

# PROSPECTS 5.0 Industry 5.0 Wiki December 2024 Patent Analysis

**Date** : 01.12.2024

**Task** : Task 5.2

**Partner** : INTRACT

**Author** : Nilay Yalcinkaya Yoruk

## PATENT SEARCH AND ANALYSIS

In the context of the **PROSPECTS 5.0** project, patent analysis (ANNEX I) serves as a critical tool to identify, assess, and monitor technological advancements and intellectual property trends relevant to the project's objectives. Patent analysis involves the systematic examination of patent documents to uncover information about state-of-the-art technologies, key players in the market, and potential opportunities or risks related to intellectual property. This analysis is particularly significant for ensuring innovation remains aligned with market needs and for avoiding potential conflicts / infringements with existing patents.

For **PROSPECTS 5.0**, patent analysis was conducted to provide strategic insights into the competitive landscape and to support the project's goal of fostering innovation in a rapidly evolving field. Moreover, the process will be repeated regularly throughout the project lifecycle. Regular updates are essential to capture emerging trends, monitor new patent filings, and adapt to shifts in the technological and market environment, ensuring the project remains at the forefront of innovation.

The updated patent analysis will be published in the PROSPECTS 5.0 Industry 5.0 Wiki <sup>1</sup>to share it with stakeholders.

To streamline the patent analysis, relevant keywords and CPC (Cooperative Patent Classification) codes were identified to focus the research effectively. Although there is no specific CPC code dedicated exclusively to Industry 5.0, a combination of multiple codes was utilized to create a tailored query text capable of accessing patents related to Industry 5.0. This approach ensured a comprehensive and accurate exploration of relevant patents.

The CPC codes employed in the analysis are listed below:

Symbol	Classification and description
<b>G</b>	<b>PHYSICS</b>

You can access the final research results through the following [link](#).

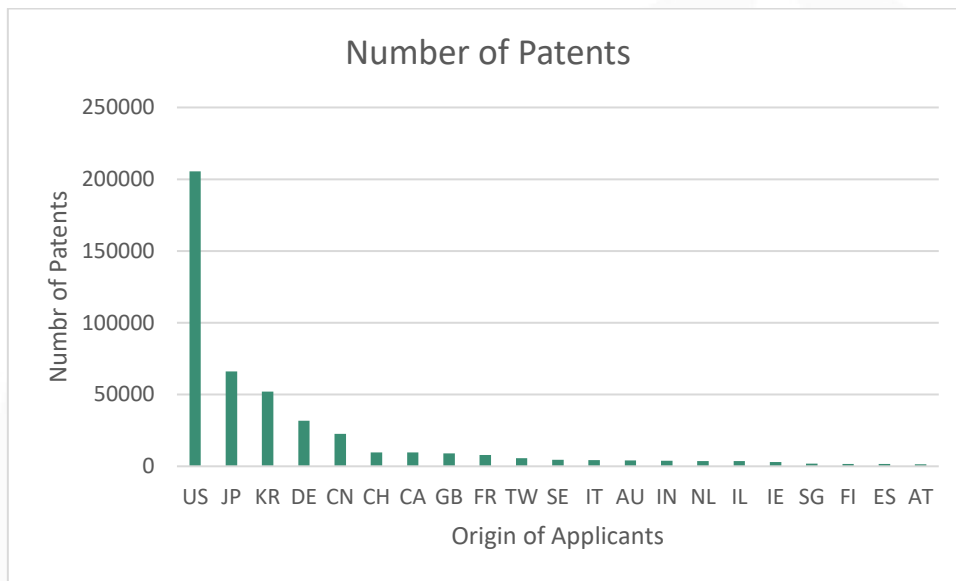

Figure 9 Origin of the Applicants by Country

The chart illustrates the distribution of patent filings by the origin of applicants, highlighting that while the data reflects the number of patent applications, not all of these patents have been granted. Nevertheless, the chart remains significant as it demonstrates the strong inclination in countries like the United States (US), Japan (JP), and South Korea (KR) to protect intellectual property rights in the field, which reflects a high level of innovation activity.

Even though not all filed patents are eventually granted, the substantial number of applications indicates a proactive approach to securing intellectual property. This trend is crucial as it signals the intention of these countries to lead in technological advancements and maintain a competitive edge in global markets.

For the European Union (EU), despite the relatively lower number of patent filings compared to leading countries, this data serves as a reminder of the need for more robust efforts in encouraging intellectual property protection. EU member states, including Germany (DE) and France (FR), must enhance their efforts to ensure that innovation is safeguarded effectively, which is vital for strengthening the region’s position in emerging fields such as Industry 5.0. The chart, therefore, highlights the growing importance of intellectual property

rights in fostering technological development and securing a competitive advantage on the global stage.

Figure 10 Number of Patent Families for Top Applicant Countries

The chart illustrates the number of patents filed in various countries, showing where applicants have chosen to seek protection for their intellectual property. This data highlights the countries where there is a strong tendency to protect patents, even though it does not confirm whether the patents have been granted yet. The high number of filings in countries like the United States (US), Japan (JP), and South Korea (KR) reflects a strong interest in securing intellectual property in these regions, which are key innovation hubs.

In these countries, the willingness to protect patents demonstrates a commitment to safeguarding technological advancements and innovations, indicating a proactive approach towards maintaining a competitive advantage in global markets. The trend of seeking protection in these countries suggests that companies and inventors see value in establishing their intellectual property rights within these jurisdictions.

For European Union (EU) countries, the relatively lower number of filings suggests that, while there is intellectual property protection, there may be room for growth in terms of innovation activities and patent filings. This underlines the importance for the EU to further encourage the protection of intellectual property to ensure that its innovations are legally safeguarded, which would improve the region's competitiveness in emerging technological fields like Industry 5.0. In summary, while the data does not reflect granted patents, it provides valuable insights into where inventors and companies prioritize securing their intellectual property, highlighting the growing trend of patent protection in these key countries.

Figure 11 Number of Patent Publications for Each Year Between 1990 – 2023<sup>2</sup>

The chart illustrates the change in the number of patent documents over the years. Starting from 1990, there has been a steady increase in the number of patent filings. Notably, after 2010, the growth rate accelerated significantly, reflecting an intensification of technological advancements and innovation activities.

Around 2020, the number of patent documents peaked, indicating a period of heightened innovation. However, a decline is observed following this peak, which could be attributed to global events such as the pandemic or a temporary slowdown in patent filing activities.

Overall, the chart highlights the rapid acceleration of R&D and innovation in recent years. To maintain and further this momentum, continuous monitoring and strategic support are essential. Projects like **PROSPECTS 5.0** play a crucial role in analysing such trends and identifying new opportunities for growth.

<sup>2</sup> According to patent laws, patents are not published until 18 months after filing unless an early publication request is made. Therefore, the number of patents published in 2024 does not include all filed patents and has been excluded from the chart for this reason.

Methods, systems, and apparatus, including computer programs encoded on computer storage media, for managing a life cycle of a label. In some implementations, a request for generating a label for a product can be received. Workflows for generation of the label can be identified. The workflows for the generation of the label can be executed. In response to executing the workflows for the generation of the label, data indicative of the generation of the label can be submitted to a health authority. Data indicative of the approval of the label for the product can be received from the health authority. In response to receiving data from the health authority indicative of approval of the label for the product, a layout for the label can be generated for the product.

(57) **ABSTRACT**

Described are a method, system, and computer program product for artificial intelligence-assisted imaging and inventory management. The method includes receiving image data from an imaging device of an item in a room of a hospital. The method also includes determining a location of the item based on a position of the imaging device. The method further includes inputting a portion of the image data to an image classification machine-learning model trained on a set of images of items associated with an inventory of the hospital. The method further includes determining an item identifier based on an output of the image classification machine-learning model. The method further includes determining an item record based on the item identifier and updating the item record. Updating the item record includes updating a last known location in the item record based on the location of the item.

The present disclosure is directed to methods and systems for assessing the risk of a release to a production environment. The release assessment system can determine the risk of a release of a feature, such as a deployable software package, to an environment based on the characteristics of the release. The release assessment system compares the words in the software code of the release to stored historical keywords to identify any patterns or similarities between the current release and historical issues/errors/incidents. Based on the identified similarity to historical releases, the system determines a risk score for releasing the feature to the production environment.

Processes and systems for recommending to clients colors and color schemes for design purposes based on measured existing surface colors without a color strategist traveling to the worksite. A design process includes: receiving from a client information and payment for color consulting services, shipping a portable color-measuring instrument to the client; providing instructions to the client for operating the color-measuring instrument, receiving measured color data that was obtained by the client using the color-measuring instrument on multiple surfaces, formulating color recommendations based on the measured color data, and providing the color recommendations to the client. A design system for selecting color includes apparatuses that: gather and provide information, receive payment, ship the color-measuring instrument, and formulate the colors or color scheme.

According to some embodiments, systems and methods are provided including instructions to: receive a workflow; retrieve a plurality of tasks associated with the received workflow; generate a timeline for execution of each task including for at least one task a lead time and a dependent task; receive a user assignment for each task; and transmit the timeline and the user assignment to a workflow scheduler and the assigned user. A communication port is coupled to the back-end application computer server to facilitate an exchange of data with a remote device to support interactive user interface displays that provide information about the timeline. Numerous other aspects are provided.

(72) Inventors: **Robert Jonathan Murphy**, Victoria (CA); **William Christopher Sonnex**, Victoria (CA)

A system for determining infrastructure locations using geographic tiling comprises an interface and a processor. The interface is configured to receive a user request. The processor is configured to determine a set of source geographic tiles based at least in part on the user request, wherein one or more source characteristics are associated with a source geographic tile of the set of source geographic tiles; determine a list of consumption geographic tiles, wherein one or more consumption parameters are associated with a consumption geographic tile of the list of consumption geographic tiles; generate a user display based at least in part on the one or more source characteristics and on the one or more consumption parameters; and provide the user display to a user associated with the user request.

(57) **ABSTRACT**

(72) Inventors: **Daniel Wayne Shrock**, Raymondville, MO (US); **Matthew Koch**, Clear Lake, IA (US)

A system is presented for monitoring grain handling systems at a grain handling site. The system includes a central control system and one or more intermediate control devices communicatively connected to the grain handling systems. The central control system is configured to provide a first user interface configured to facilitate creation of a process flow and programming of the intermediate control devices to operate in accordance with the process flow. In response to detecting an error in the process flow during operation, the central control system is configured to prompt the plurality of intermediate control devices to cause the set of the grain handling systems to perform a first set of actions indicated by the process flow if the error occurs before the grain handling systems and perform a second set of actions indicated by the process flow if the error occurs after the grain handling systems.

Computer implemented methods, systems, and computer program products include program code executing on a processor(s) that obtains a planning problem. The program code obtains a bound on a number of plans (to address the planning problem). The program code identifies symmetries of the planning problem. The program code utilizes the symmetries to identify an orbit search space of the planning problem. The program code executes a two-phase search iteratively over the orbit space to identify surrogate plans in the orbit space. The program code generates new plans by utilizing the surrogate plans and the symmetries of the planning problem to map the surrogate plans to new plans. The program code extends the new plans. The extended new plans comprise the set of solutions for the planning problem.

(54) Bezeichnung: **Verfahren zur Vereinzelung eines verpackten Guts mittels eines Roboterarms und Vorrichtung umfassend einen Roboterarm zur Vereinzelung eines verpackten Guts**

(57) Zusammenfassung: Die Erfindung betrifft ein Verfahren zur Vereinzelung von verpackten Gütern (10, 14, 20) mittels mindestens eines Roboterarms (13), umfassend folgende Schritte:

- Erstellen einer Messwertmatrix der verpackten Güter (10, 14) mittels mindestens eines Sensors (17);
- Ermitteln einer Ausdehnung, eines Bedeckungszustands, einer Position und/oder einer Ausrichtung mindestens eines bestimmten Guts (14) der verpackten Güter (10, 14, 20) mittels Inferenz mit einem statistischen Modell und/oder mittels eines Näherungsverfahrens unter Eingabe der Messwertmatrix;
- Erstellen eines Steuerungsdatensatzes für den Roboterarm (13) unter Berücksichtigung der Ausdehnung, des Bedeckungszustands, der Position und/oder der Ausrichtung des bestimmten Guts (14);
- Ergreifen des bestimmten Guts (14) mittels des Roboterarms (13) nach dem Steuerungsdatensatz; und
- Vereinzeln des bestimmten Guts (14) von den anderen verpackten Gütern (10) unter mindestens einer ziehenden und vereinzelnden Bewegung (19) nach dem Steuerungsdatensatz mittels des Roboterarms (13).

Des Weiteren betrifft die Erfindung eine Vorrichtung (21) zur Vereinzelung von verpackten Gütern (10, 14, 20), umfassend mindestens einen Roboterarm (13), mindestens einen Sensor (17) und ein Computersystem (15).

Embodiments relate to determining an availability of a service option for delivery of an order placed with an online system. The online system receives an order placed with the online system. The online system accesses a computer model trained to predict a value of metric for an order placed with the online system. The online system applies the computer model to predict the value of the metric for the order. The online system determines which service option of a plurality of service options of the online system is available for delivery of the order, based at least in part on the predicted value of the metric and a threshold. The online system causes the device of the user to display an availability of the determined service option for delivery of the order.

(57) **ABSTRACT**

A package sortation system is provided. The system receives an inventory of multiple shipping resources. The system receives a blank sortation label having three or more predefined regions, each predefined region associated with a unique color and is laced with a coloring agent of the region's unique color. The coloring agent remain invisible until activated to become visible with the region's unique color. The system extracts first and second data from a sortation instruction. The first data and the second data jointly identify one of the multiple shipping resources. The system selects one region of the three or more predefined region based on the first data, and a symbol (or pattern) based on the second data. The system prints the selected symbol on the selected region of the sortation label by activating the coloring agent of the selected region.

(21) Appl. No.: **18/741,374**

A conveyance device includes a fixed base having a large gear, a turning body supported by the fixed base via a bearing, two or more servomotors, a conveyance arm, and two or more speed reducers. The speed reducer includes a housing integrated with the turning body, a planetary carrier rotatably supported inside the housing, an internal gear provided inside the housing, a sun gear connected to an output shaft of the servomotor, a plurality of planetary gears arranged around the sun gear and rotatably supported by the planetary carrier, and an output gear rotating integrally with the planetary carrier. The planetary gear meshes with the sun gear and meshes with the internal gear. The output gear has a smaller diameter than that of the large gear and meshes with the large gear outside the large gear.

(57) **ABSTRACT**

Embodiments relate to order specific expansion of an area that encompasses pickers available for accepting an order placed with an online system. The online system accesses a computer model trained to predict an attractiveness metric for the order and applies the computer model to predict a value of the attractiveness metric for a first order. The online system classifies the first order into a first set or a second set, based on the value of the attractiveness metric and a threshold. Based on the classification, the online system expands over time a size of an area that encompasses a set of pickers available for accepting the first order. The online system causes a device of each picker in the set of available pickers located within the area of the expanded size to display an availability of the first order for acceptance by each picker in the set of available pickers.

Embodiments relate to an automatic detection of fraudulent behavior for a transaction at an online system. The online system requests a large language model (LLM) to determine, based on a prompt input into the LLM, information about a refund event for a first order placed by a user of the online system. The online system accesses a computer model trained to detect a fraudulent behavior associated with an order placed with the online system. The online system applies the computer model to determine a score associated with the refund event, based on the information about the refund event received from the LLM. The online system determines, based on the score, whether the refund event was due to a fraudulent behavior of the user. The online system performs at least one action associated with the online system, based on the determination whether the refund event was due to the fraudulent behavior.

(57) **ABSTRACT**

A method facilitating operation of a fabrication machines includes generating, by a fabrication center application (FCA); an enhanced cut list (ECL) usable by a cutting machine control application (CMCA) to direct a cutting machine (CM) to cut a work piece (WP) into  $\geq 2$  pieces; an enhanced bend list including x,y,z positional information (PI) for bending  $\geq 1$  piece(s) of the  $\geq 2$  pieces at least once; and etching routine(s) (PR) for etching human- and/or computer-readable bend instructions (BI) including the x,y,z PI on the WP or the  $\geq 1$  piece(s); and transmitting, by the FCA, and via a fabrication center connector websocket: the ECL to a fabrication desktop application (FDA) of the CM to enable use of the ECL by the CMCA to cut the WP; and the PR(s) to the FDA and/or an etcher to enable use thereby to etch the BI(s) on  $\geq 1$  location(s) on the WP or the  $\geq 1$  piece(s).

Various methods and processes, apparatuses/systems, and media for systemically and dynamically capturing digital experiences are disclosed. This disclosure presents methods and apparatuses for implementing a platform, language, cloud, and database agnostic automatic digital experiences capturing module configured to systemically and dynamically capture digital experiences to support guided training, process and procedures, and job aids. Customer journeys and corresponding validation steps are defined; test scenarios and defines test execution parameters are built. These definitions and configurations built are called by a scheduler, on a recurring basis, which executes the test scenarios against a system under test; and captures the resulting screenshots, videos, and interactions including highlights on image of user required selections. Results are then published and captured into an Experience database. A narrative author adds instructional text or context narratives which are linked to test scenario steps to the database.

(57) **ABSTRACT**

(21) Appl. No.: **18/335,759**

A precision handling system including a gripper, a flexure, and a ball transfer. The gripper includes a first jaw and a second jaw configured to provide a gripping force therebetween for gripping and moving an object. The flexure is coupled to the gripper and configured to provide compliance in at least one direction. The ball transfer is coupled to the gripper. The ball transfer includes a ball configured to engage the object to transfer the gripping force thereto and configured to spherically rotate to allow the object to move with respect to the first jaw.

**ABSTRACT**

A method of controlling a household appliance includes setting, within an augmented reality note, control commands for the household appliance. The method also included receiving, on a remote user interface device, the augmented reality note. The method further includes activating the household appliance based on the control commands set within the received augmented reality note.

(57) **ABSTRACT**

A proactive execution system receives messages or other information from a plurality of different information channels. The proactive execution system automatically identifies messages that include a request for a user to perform a task. The proactive execution system then automatically generates a plan for executing that task and calls a plan execution system, with the plan, to perform the task. The proactive execution system receives a result from the plan execution system and generates an output indicative of that result, for access by the user.

The subject matter of this specification can be embodied in, among other things, a method for controlling a turbine engine that includes measuring, by a speed sensor, waveforms indicative of a speed of a rotating machine. Receiving the waveforms from the speed sensor and providing data representing the waveforms to a first signal path and to a second signal path, wherein the second signal path is isolated from the first signal path such that data communications at the second signal path do not interfere with communications on the first signal path. Controlling, responsive to the data received along the first signal path, one or more operations of the rotating machine. Storing, the data received along the second signal path, individual samples of the data in association with a respective timestamp indicating a time that the data was received.

(57) **ABSTRACT**

The present invention discloses a method for controlling a multi-robot collaborating intelligent drilling and riveting system for a shelter, including the following steps: generating a robot scanning trace according to a key characteristic parameter of the shelter; performing laser scanning on an angle aluminum edge to acquire a drilling position of the shelter; establishing a task allocation mechanism, establishing a drilling and riveting task propensity model according to the task allocation mechanism, and allocating automatic drilling and riveting tasks to multiple robots based on the drilling and riveting task propensity model; and establishing a drilling angle compensation value model, where automatic drilling and riveting robots perform position compensation based on the drilling angle compensation value model to complete drilling and riveting.

(57) **ABSTRACT**

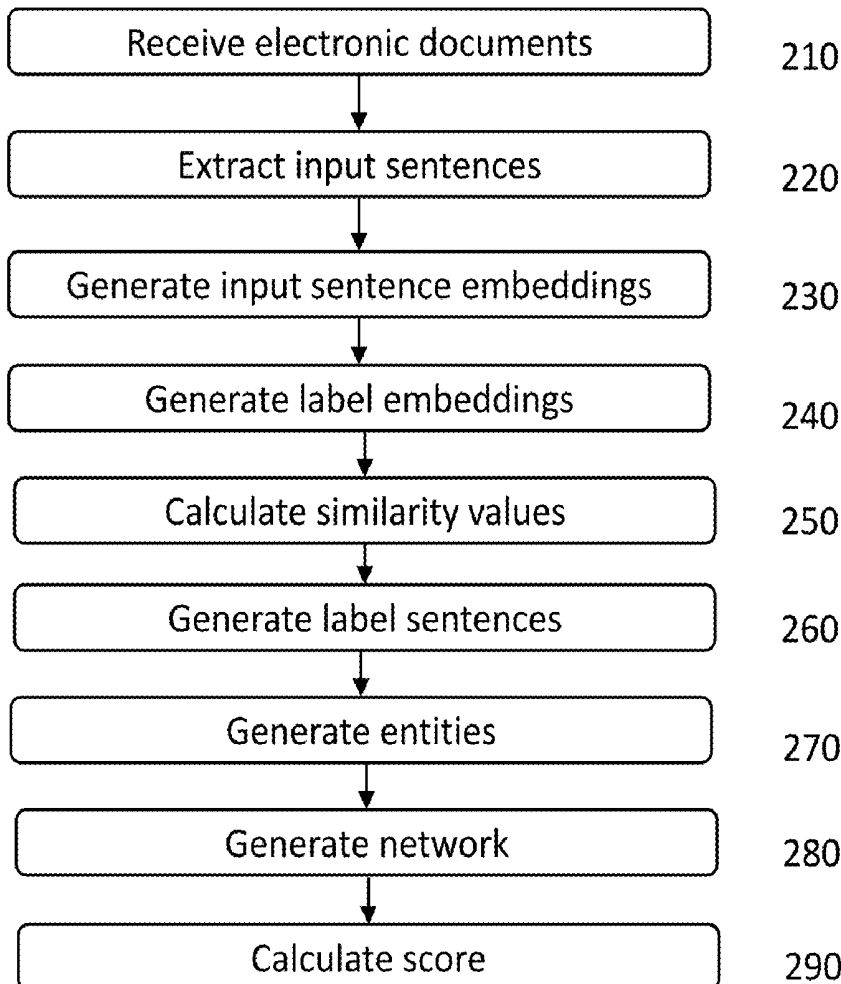

A method for evaluating electronic documents based on a framework having a plurality of labels includes receiving a plurality of electronic documents, each electronic document having a company identifier. The method includes extracting a plurality of input sentences from each electronic document. The method includes generating a plurality of input sentence embeddings, each input sentence embedding corresponding to one of the input sentences. The method includes generating a plurality of label embeddings, each label embedding corresponding to one of the labels. The method includes calculating a plurality of similarity measures between each of the input sentence embeddings and each of the label embeddings. The method includes generating a plurality of label sentences for each of the labels based on the similarity measures, each of the label sentences being associated with one of the company identifiers. The method includes generating a plurality of entities for each of the label sentences.

(72) Inventors: **Masoud Aghadavoodi Jolfaei**, Wiesloch (DE); **Frank Brunswig**, Heidelberg (DE)

Systems and methods described herein relate to techniques for identifying and using context data to prioritize reported issues in a software context. A data record of a reported issue is accessed. The reported issue is associated with a software offering provided to a user. The data record comprises issue metadata that includes a first priority rating for the reported issue. The issue metadata is used to identify a relation between the reported issue and context data associated with the user. A second priority rating for the reported issue is generated based on at least the context data. The second priority rating may differ from the first priority rating. The second priority rating is presented at a computing device, optionally together with the first priority rating via a graphical user interface.

A computing system assists in large language model system assisted investigations. The computing system includes network connection hardware configured to connect to a large language model and configured provide to investigation context and investigation goals to the large language model system. The network connection receives from the large language model system, an indication of suggested steps to perform in an investigation, including specific computer executable code to perform a skill in the first step, the skill comprising a supplemental access, analytic or enrichment function. The computing system includes a user interface with a tree interface that causes display of the indication of the suggested steps in a tree format. The computing system is configured to execute the computer executable code to cause the computer system to perform the supplemental access, analytic or enrichment function.

A method for contact center agent incentivization via auto-  
mated gamification according to an embodiment includes  
transferring an interaction between a contact center agent  
and a user to an automated agent, prompting, by the auto-  
mated agent, the user to reward the contact center agent  
based on the interaction between the user and the contact  
center agent, receiving a selection of a reward option made  
by the user in response to prompting the user to reward the  
contact center agent, determining a point value associated  
with the user's selected reward option based on a mapping  
table, and associating the user's selected reward option with  
the contact center agent in an agent rewards table.

(57) **ABSTRACT**

A system for public and private warehouses management with automated equipment includes a public warehouse having multiple floors and an outer perimeter; an automated guided vehicle operation area located in the outer perimeter of the public warehouse; a transfer station space located out of each side of the public warehouse; an automated guided vehicle space adjacent to one side of the transfer station space away from the public warehouse; a maintenance station space arranged at a predetermined location adjacent to the automated guided vehicle space; an inbound/outbound space adjacent to one side of the automated guided vehicle space away from the public warehouse; and two private warehouses connected with the inbound/outbound space. Each of the private warehouses has multiple floors corresponding to the floors of the public warehouse.

(57) **ABSTRACT**

A delivery assistance device includes controller that creates a parcel delivery route of a delivery vehicle loaded with multiple parcels. The controller obtains position information of the multiple parcels in the delivery vehicle. The controller creates the delivery route based on the position information of the multiple parcels such that a parcel at a position where the parcel is easily unloaded from the delivery vehicle can be delivered to a delivery destination earlier than a parcel at a position where the parcel is not easily unloaded from the delivery vehicle.

(57) **ABSTRACT**

An energy supply station can include a mechanical arm, an energy delivery receptacle, and one or more processors. The processors can be configured to detect an arrival of a vehicle at the energy supply station; transmit an indication of the arrival to a remote computer, causing activation of a virtual interface; and move the mechanical arm, based on input at the virtual interface, to cause the energy delivery receptacle to contact or couple with an energy input receptacle of the vehicle.

(57) **ABSTRACT**

Computer-implemented systems and methods are disclosed, including for evaluation of computer-based models in a management framework. A computer-implemented method may include, for example, receiving one or more inputs including requesting to add an evaluation configuration to a defined modeling objective, specifying at least a first evaluation data set for the evaluation configuration, specifying at least a first evaluation library for the evaluation configuration, and specifying at least a first subset definition for the evaluation configuration. A computer-implemented method may in response to the one or more user inputs include: creating, storing, and/or updating the evaluation configuration. A computer-implemented method may include evaluating, based on the evaluation configuration, the one or more models associated with the defined modeling objective.

(54) Title of the Invention: **System and method for sorting and/or packing items**  
Abstract Title: **System and method for sorting and/or packing items**

(57) A robot-assisted method of sorting and/or packing vine fruit into containers 142 by a hybrid robotic and human system comprises placing vine fruit 133 onto a computer-controlled conveyor 130a, 130b, inspecting the vine fruit 133 for defects, removing any fruit identified as having a defect from the conveyor 130a, 130b, weighing the vine fruit, in the event that the weight of the vine fruit 133 is above a selected threshold, cutting the vine fruit using a robotic end effector 120 mounted on a robotic arm 110 to produce a cut vine having an estimated weight below the selected threshold, placing the cut vine into a container 142, checking the weight of the container 142 holding the cut vine, determining whether the weight of the container 142 holding the cut vine is within a selected threshold weight range, and in the event that the determined weight is outside the selected threshold weight range, topping up the container with vine fruit to reach the selected threshold weight range. Placing the cut vine into a container 142 may comprise using a robotic end effector 122 mounted on a robotic arm 114. Weighing the vine fruit 133 may comprise making a determination based upon received image data of the vine fruit 133. Inspecting the vine fruit 133 for defects may comprise applying a trained machine learning model to received image data of the vine fruit 133. Determining whether the weight of the container 142 holding the cut vine is within a selected threshold weight range may comprise passing the container 142 over an in-line weight scale 260.

(54) **COMPUTER-IMPLEMENTED METHOD OF FORECASTING AN OCCUPANCY OF AN ELECTRONIC PARCEL COMPARTMENT SYSTEM**

(57) A computer-implemented method of forecasting an occupancy of an electronic parcel compartment system (110) is presented in this disclosure. The method includes determining a forecasted occupancy of the electronic parcel compartment system (110) by applying a prediction of pick-up of parcel(s) to predict parcel locker(s) of the electronic parcel compartment system 110 that is/are estimated to contain a parcel.

(72) Inventors: **Kumar ABHINAV, Hazaribag (IN); Alpna DUBEY, Bangalore (IN); Shubhashis SENGUPTA, Bangalore (IN); Piyush Goenka, Bangalore (IN)**

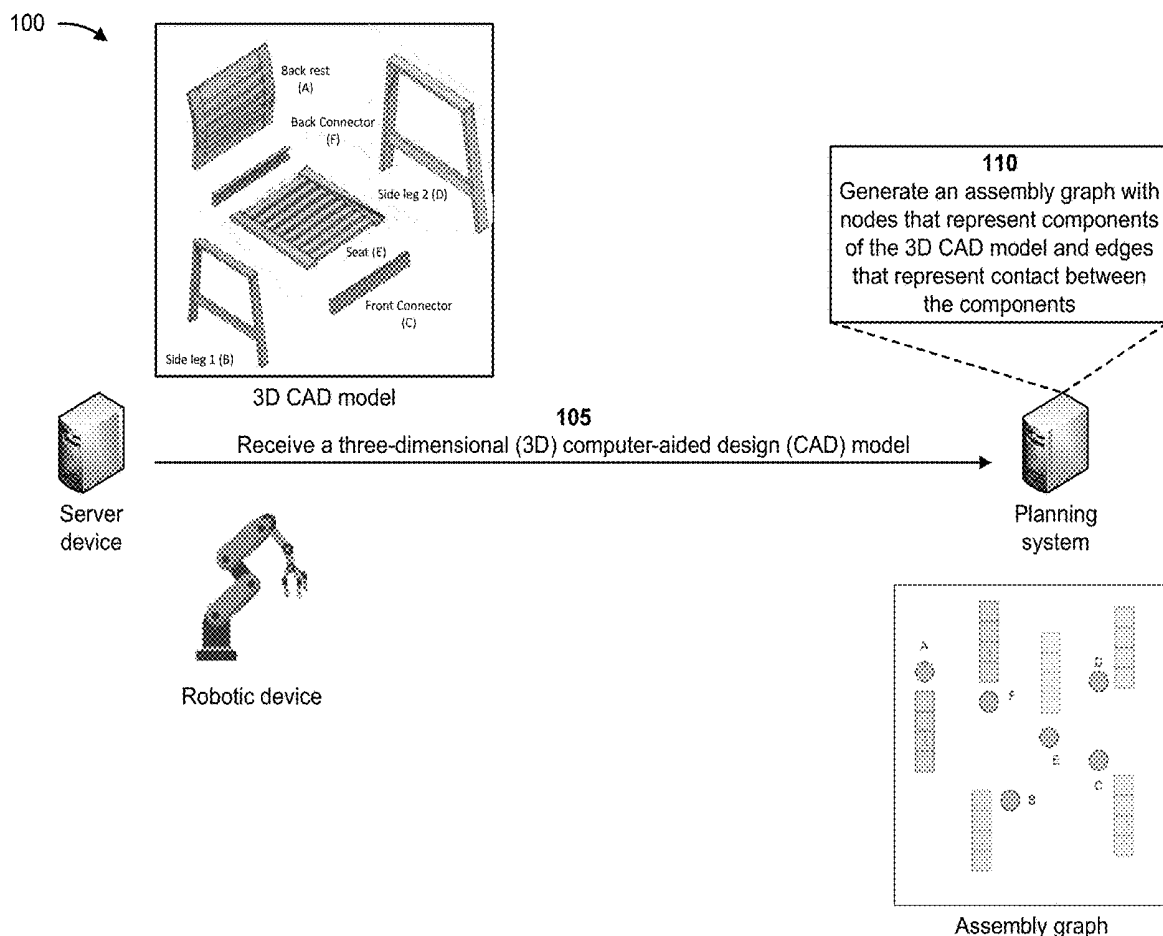

A device may receive a three-dimensional (3D) computer-aided design (CAD) model, and may generate an assembly graph with nodes that represent components and edges that represent contact between the components. The device may generate component graphs for the components, and may generate an assembly descriptor based on the assembly graph and the component graphs. The device may process the assembly descriptor, with a graph convolution network model, to generate node embeddings, and may apply pooling to the node embeddings to generate graph embeddings. The device may calculate a cross attention between the components to generate component interrelations, and may utilize the graph embeddings and the component interrelations to predict links between the components. The device may predict poses and joint axes for the components, and may generate assembly instructions based on the graph embeddings, the component interrelations, the links, the poses, and the joint axes.

(72) Inventors: **Masoud ABBASZADEH**, Clifton Park, NY (US); **Johan Michael REIMANN**, Ballston Spa, NY (US); **Hema K ACHANTA**, Schenectady, NY (US)

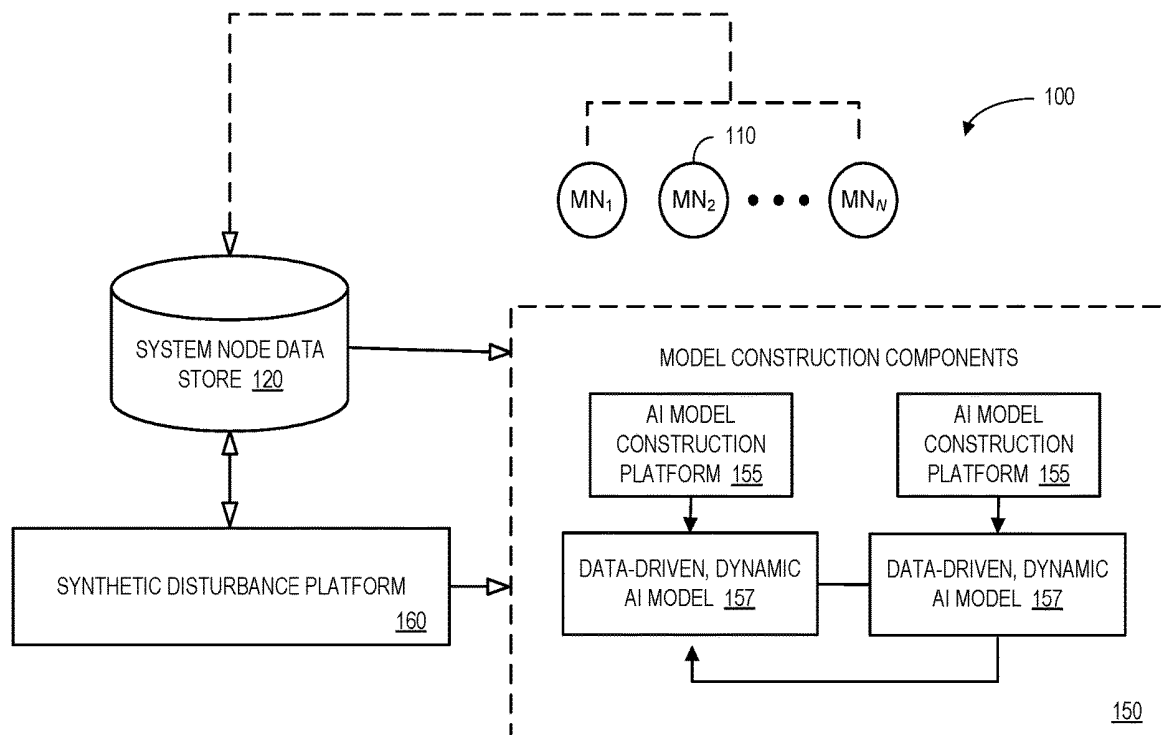

In some embodiments, a system node data store may contain historical system node data associated with normal operation of an industrial asset, and a plurality of artificial intelligence model construction platforms may receive historical system node data. Each platform may then automatically construct a data-driven, dynamic artificial intelligence model associated with the industrial asset based on received system node data. The plurality of artificial intelligence models are interconnected and simultaneously trained to create a digital twin of the industrial asset. A synthetic disturbance platform may inject at least one synthetic disturbance into the plurality of artificial intelligence models to create, for each of a plurality of monitoring nodes, a series of synthetic disturbance monitoring node values over time that represent simulated abnormal operation of the industrial asset.

(57) **ABSTRACT**

The present disclosure relates to an apparatus for printing three-dimensional, 3D, objects by a 3D printer. The apparatus comprises interface circuitry configured to receive a G-code file comprising instructions for 3D printing of one or more 3D objects. The apparatus further comprises processing circuitry configured to classify a 3D object represented by the G-code file, and restrict 3D printing of the 3D object if the 3D object is classified as at least a part of a dangerous/illegal object.

**(54) METHOD FOR LOCATING OBJECT ATTACHED TO WIRELESS COMMUNICATION DEVICE**

(57) The wireless communication device (100) includes a plurality of environmental sensors (106) configured to measure various environmental properties of an environment surrounding the object (200). The method comprises the steps, performed by a processor (114), of:

- receiving measured environmental data from the plurality of environmental sensors (106) measuring the various environmental properties;
- determining location information of the object (200) using the measured environmental data.

(54) **A METHOD FOR ONBOARDING A DEVICE INTO A DATA NETWORK**

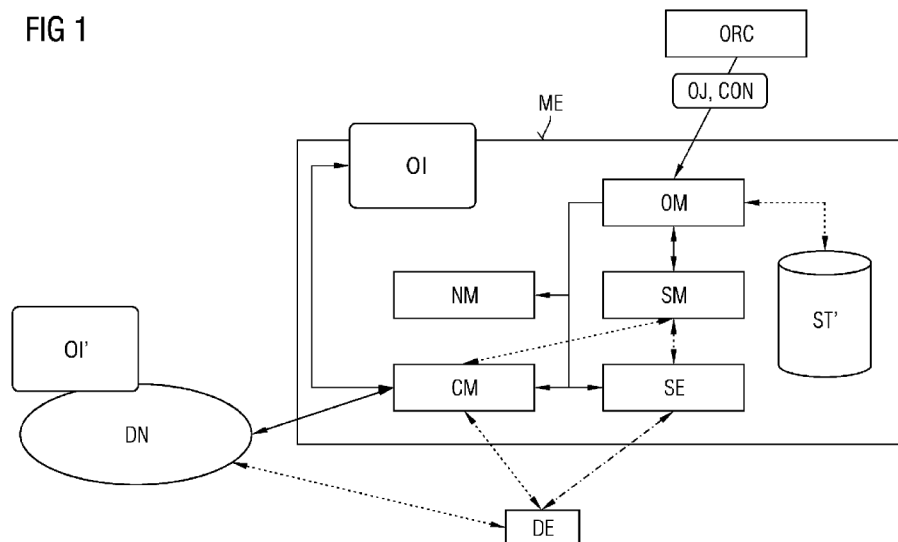

(57) The invention refers to a method for onboarding a device (DE) into a data network (DN), comprising the following steps:

- receiving by an onboarding management module (OM) of a mobile entity (ME) an onboarding job (OJ) and configuration data (CON) for an onboarding of the device (DE) based on the onboarding job (OJ);
- positioning the mobile entity (ME) next to the device (DE) by the aid of a navigation module (NM) of the mobile entity (ME), where the navigation module (NM) recognizes when the mobile entity (ME) is next to the device (DE);
- establishing a communication between the onboarding management module (OM) of the mobile entity (ME) and the device (DE) next to it via a communication module (CM) of the mobile entity (ME);
- performing an onboarding process of the device (DE) into the data network (DN) via the established communication based on the configuration data (CON).

nizes when the mobile entity (ME) is next to the device (DE);

- establishing a communication between the onboarding management module (OM) of the mobile entity (ME) and the device (DE) next to it via a communication module (CM) of the mobile entity (ME);
- performing an onboarding process of the device (DE) into the data network (DN) via the established communication based on the configuration data (CON).

Manufacturing analysis is provided. The method comprises identifying a feature of a product model defined by geometric, physical, and systems elements with semantic labels, names or title descriptions. Machine readable semantic links are created that connect the feature to elements in an enterprise knowledge library according to a machine readable ontological knowledge model. A producibility risk or opportunity for the product model is identified according to semantic relationships of the elements in the enterprise knowledge library linked to the feature. A user is alerted of the producibility risk or opportunity, and a note is added to a manufacturing design specification for the product model. The note provides a number of solutions for the producibility risk or opportunity, wherein the solutions are identified in the enterprise knowledge library according to the semantic relationships.

A semiconductor fabrication control system and method of operation can include: detecting a status with a control board communicatively coupled to a semiconductor fabrication tool; collecting process information from the semiconductor fabrication tool with the control board based on the status changing or a predetermined time elapsing; storing the process information to a server with the control board communicatively coupled to the server by a network connection; and engaging an auto-stop mechanism of the semiconductor fabrication tool to prevent the semiconductor fabrication tool from running based on the process information being wrong.

A gripper mounted on a robot is used in a smart factory to pick a door loaded on a pallet. The gripper includes: a frame mounted on a tool changer of the robot; a picking unit mounted on a front of the frame and applying pressure to and regulating each of upper and lower points of an opening formed in an inner panel of the door through a bundle pin locator; and a pressure control valve adjusting the pressure of guide air cylinders. The gripper further includes: a side clamping unit mounted on the frame and holding a side point of the opening by a fixing locator and a clamber operating with a driving force of a clamping cylinder; and a control unit adjusting a moving distance of the robot based on a distance difference between the side clamping unit and the inner panel.

(57) **ABSTRACT**

A mobile robot calibration device comprises a first positioning block and a second positioning block. The first positioning block has a positioning protrusion, and the second positioning block has a positioning slot. The positioning protrusion complements, and is adapted to mate with, the positioning slot. One of the first positioning block or the second positioning block is adapted to be installed on a flange or tool at an end of a mobile robot, and the other is adapted to be installed on a support base (e.g., a workbench).

(54) **MACHINE FOR RECTIFYING PANELS FOR CONSTRUCTION, FOR EXAMPLE, FOR WALL COVERINGS OR FOR FLOORINGS**

(57) A machine for rectifying panels for construction, for example, for wall coverings or for floorings, comprises a structure for supporting and moving panels in a supply direction (L). The machine further comprises at least one rectification tool (11) which is configured to operate on the panels and at least one movement mechanism (40) for adjusting the position of the rectification tool with respect to the supply direction (L) in an adjustment direction (T) in order to compensate for the progressive wear of the rectification tool (11) in contact with the panels. The machine also comprises at least one vibration sensor (64) which is provided to detect the vibrations of the at least one rectification tool (11) during use, during the contact with the panels. A data-processing system is programmed to receive the vibration data which are detected, during use, by the vibration sensor (64) and to compare them with reference vibration data which indicate a predetermined working condition of the rectification tool in contact with the panels, which corresponds to a pre-

determined position of the rectification tool with respect to the supply direction (T). The processing system outputs an adjustment activation instruction in order to activate the movement mechanism (40) in order to move the rectification tool in the adjustment direction (T) when a predetermined deviation between the vibration data which are detected by the vibration sensor with respect to the reference vibration data is exceeded. The processing system further outputs an adjustment deactivation instruction in order to deactivate the movement mechanism (40) in order to interrupt the movement of the rectification tool in the adjustment direction (T) when the deviation between the vibration data detected by the vibration sensor and the reference vibration data is within a predetermined value.

Implementations are provided for generating a plurality of simulated training instances based on a recorded user-directed robot control episode, and training one or more robot control policies based on such training instances. In various implementations, a three-dimensional environment may be simulated and may include a robot controlled by an external robot controller. A user may operate the robot controller to control the robot in the simulated 3D environment to perform one or more robotic tasks. The user-directed robot control episode, including responses of the external robot controller and the simulated robot to user commands and/or the virtual environment, can be captured. Features of the captured user-directed robot control episode can be altered in order to generate a plurality of training instances. One or more robot control policies can then be trained based on the plurality of training instances.

(57) **ABSTRACT**

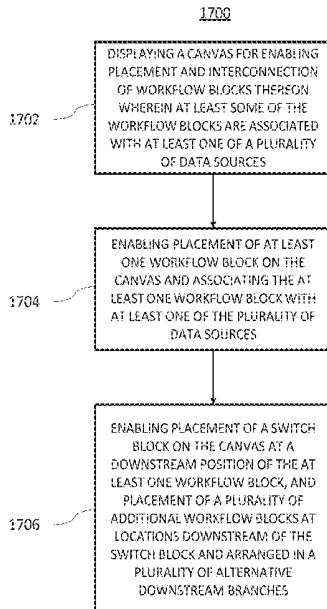

Systems, methods, and computer-readable media for workflow construction operations include displaying a canvas for enabling placement and interconnection of workflow blocks with some of the workflow blocks being associated with data sources, enabling placement of a workflow block on the canvas and associating the at least one workflow block with at least one of a plurality of data sources, enabling placement of a switch block on the canvas at a downstream position of the workflow block and placement of a plurality of additional workflow blocks at locations downstream of the switch block and arranged in a plurality of alternative downstream branches. The switch block is configured to direct trigger action flow to the plurality of alternative downstream branches. The switch block is configured with a plurality of differing queries associated with the plurality of alternative downstream branches, at least one of the differing queries being associated with the data sources.

(57) **ABSTRACT**

A method and system of providing users with dynamic content about a specific task during access of an application based on previous in-app activity by the app's community of users for the task. The system identifies experienced user activity that represents an efficient performance of the task. The activity is stored in a repository for use by a dynamic content generation module. When subsequent users appear to need assistance in performing the task, the system can present content that is based on the more experienced users' activity. As additional data is collected, this content can be updated.

Modular container delivery systems and methods are described herein. A modular container delivery system may be implemented to facilitate autonomous delivery of packages to customers. A modular container, as described in greater detail below, may be attached to a battery operated electric vehicle (BEV) and autonomous driving platform chassis. The container system itself contains a package sorting mechanism that is configured to move packages inside the vehicle, organize them into separate section of the vehicle and retrieve packages for delivery on as needed.

(57) **ABSTRACT**

An elevation change detection system is provided for a robot having an operating system. The elevation change detection system includes a sensor, a processor electrically connected to the sensor, and a memory. The memory has instructions that, when executed by the processor, cause the processor to perform operations including detect an edge of a structure with the sensor, classify an elevation change associated with the edge, and adjust the operating system based on the elevation change.

(57) **ABSTRACT**

A system includes a plurality of manufacturing tools configured to perform a physical action contributing to manufacture of a product. The system further includes one or more programmable controllers coupled to the plurality of manufacturing tools and one or more lineside units coupled to the one or more programmable controllers. The one or more lineside units each configured to cooperate with the one or more programmable controllers to discover tool data describing services performed by one or more of the plurality of manufacturing tools, including command sets. The one or more lineside units receive a process definition from a remote manufacturing control system and translate the process definition into commands to the plurality of manufacturing tools according to the tool data. Results of implementing the commands is asynchronously reported to the manufacturing control system. The process definition may be retrieved directly from a manufacturing database.

An AI-assisted project risk detection platform include a plurality of data trackers configured to automatically collect relevant data associated with a project, the relevant data being selected from the group consisting of project scope, tasks, project management, budget, resources, project team members, project milestones, project timeline, project status, product launch plan, market trends, economic trends, competitive landscape, legal and regulatory environment, consumer behavior, consumer preferences, customer feedback, and social media. These data trackers are installed at critical points along project execution path or product launch plan. The platform further includes an AI-assisted data analysis module configured to receive the relevant data collected by the data trackers, analyze the relevant data, identify emerging vulnerabilities and issues associated with the project, and determine corrective recommendations. The platform generates and transmits notification messages to project team members and stakeholders to notify them about the identified vulnerabilities, issues, and the corrective recommendations.

Methods and systems for supply chain optimization utilizing a polymatic solver architecture. Data is entered into a memory device. A graph network model is applied to the data to create a neural network. The neural network is parsed to divide the neural network into a plurality of subnetworks. Each subnetwork is sent to a job execution component. Each subnetwork is processed to produce a plurality of subnetwork scenarios. The subnetwork scenarios are superimposed to identify an optimum supply chain scenario. The optimum supply chain scenario is implemented as a plan.

A decision tool models emissions for a sustainable aircraft fuel (SAF) for the lifecycle of the fuel. The decision tool includes a controller module configured to receive data related to at least one fuel pathway for the fuel wherein the fuel pathway considers emissions from initial feedstock production to fuel burn during flight and arrival. The decision tool determines at least one fuel pathway for the fuel used to fuel the aircraft during a flight, models an emission score for the at least one fuel pathway, and then outputs the emission score where a user can purchase the fuel or make other decisions based upon the fuel pathway provided by the decision tool.

(54) Title: DISTRIBUTION SHIFTING CONTROL METHODOLOGIES FOR CONVERTING GLASS TUBE TO GLASS ARTICLES

FIG. 1

(57) Abstract: Methods for controlling a converter includes operating the converter to produce glass articles from glass tubes, where the converter includes a plurality of processing stations and operating the converter includes translating the glass tubes through the processing stations in succession. The methods include measuring an attribute of the glass articles during or after conversion, developing an attribute distribution from measured values of the attribute, and shifting the attribute distribution within a specification range for the attribute. Shifting the attribute distribution within the specification range increases a yield of the glass articles. A system for converting glass articles from glass tubes includes a converter, a measuring device, a control device, and a control system operable to execute portions of or all of methods disclosed herein for controlling the converter.

(57) **ABSTRACT**

Systems and methods for automatic filling of packaging with a food product that includes both a solid and a liquid are provided. A filling device includes: a vessel configured to hold the food product; a first piston system configured to push a portion of the food product within the vessel through a first through hole in a bottom of the vessel. The first piston system includes: a first piston; and a first sleeve that surrounds at least a portion of the first piston. The filling device further includes first actuators configured to independently actuate the first piston and the first sleeve such as to cause the portion of the food product to be pushed through the first through hole in the vessel.

(57) **ABSTRACT**

A computer-implemented system for assessing a project comprising a project readiness assessment unit for assessing a project readiness of a project based on project data and for generating a project assessment score. The system can include a project diagnostic assessment unit for receiving project cost data and for determining an accuracy of a cost associated with the project based on the project cost data and for generating a project cost accuracy score. A project schedule assessment unit can be employed for applying one or more schedule analysis and assessment techniques to the project schedule data to assess a quality and an accuracy of a project schedule and for generating a project schedule score. A project risk assessment unit can process project risk data for determining an inherent risk score associated with the project. A project control assessment unit can process project control data for generating a project control score.

(57) **ABSTRACT**

(72) Inventors: **Moresb Wankhede**, Dartford (GB); **Leon Parsons**, St. Ives (GB); **Merylatha Meriyani**, Hyderabad (IN); **Timothy Cliff**, St. Ives (GB)

A prescriptive intelligent system is provided for mobile industrial workers. At least one data lake stores data associated with industrial assets and processes. At least one orchestration engine applies at least one information standard to at least one ingestion pipeline, which is enabled to process data from the at least one data lake and use artificial intelligence algorithms that identify actionable insights in the data, wherein actionable insights comprise solutions implemented in historical environments and feasible for other environments. A system stores the data as a knowledge graph across different types of technology components for user interfaces. A user interface responds to an excursion associated with an industrial asset and/or process by providing an overview of at least one of an industrial asset and/or process, an alarm, a root cause analysis, and/or a prescribed solution, and coordinates outputs from some of the different types of technology components.

Embodiments relate to providing self-learning automated information technology change risk prediction. A processor inputs a change request to a first machine learning model, the first machine learning model determining at least one word pair in the change request, the change request being a modification in an IT environment. The processor classifies the at least one word pair into a change category for the IT environment using a second machine learning model, the change category identifying a type of the modification to be executed in the IT environment. The processor determines a likelihood of causing a problem in the IT environment as a result of executing the modification. The processor automatically performs an action to prevent the modification of the change request in the IT environment.

A resource usage amount management system stores process management data representing a flow of a plurality of tasks related to production or provision of an item. For each of the tasks, the process management data includes: task information that includes information related to the task with respect to each item related to the task; element information that includes information related to each of a plurality of elements associated with the task, and is associated with the task information on the task; and environment information that includes information related to the resource usage amount for each of the plurality of elements, and is associated with the element information on the element. The resource usage amount management system calculates the resource usage amount in an item-by-item basis, according to information represented by the process management data, and association of information.

(54) Title: A METHOD OF CONTROLLING A CHEMICAL PROCESS

(57) Abstract: A method of controlling a chemical process is described, comprising: providing a feedstock to a chemical plant; processing the feedstock in the chemical plant to implement a chemical process to produce a product; repeatedly obtaining a set of parameters of the chemical process using sensors; and operating the chemical plant in accordance with control variables based on the sets of parameters by: discarding outliers from the sets of parameters; and simulating the chemical process using the retained sets of parameters to estimate a set of control variables for the chemical plant that optimises an objective function, wherein the step of discarding outliers from the sets of parameters comprises: projecting the sets of parameters into a first lower dimensional space to provide projected parameters; identifying outliers using the projections of the parameters in the first lower dimensional space; and discarding at least some of the sets of parameters corresponding to the outliers.

Disclosed are systems, methods, and apparatuses, including computer programs encoded on computer storage media, for operation of a robotic welding system. In one aspect, a method for calibrating a tool center point (TCP) of the robotic welding system includes identifying, based on multiple images, a location of a tip of a protrusion extending from the weldhead. Each image of the multiple images including at least a portion of the protrusion extending from a tip of the weldhead. The tip of the weldhead is associated with a first frame of reference. The method also includes determining, based on the location of the terminal end of the protrusion, a second frame of reference that is offset from the first frame of reference. The method further includes generating one or more TCP calibration values based on the second frame of reference. Other aspects and features are also claimed and described.

(57) **ABSTRACT**

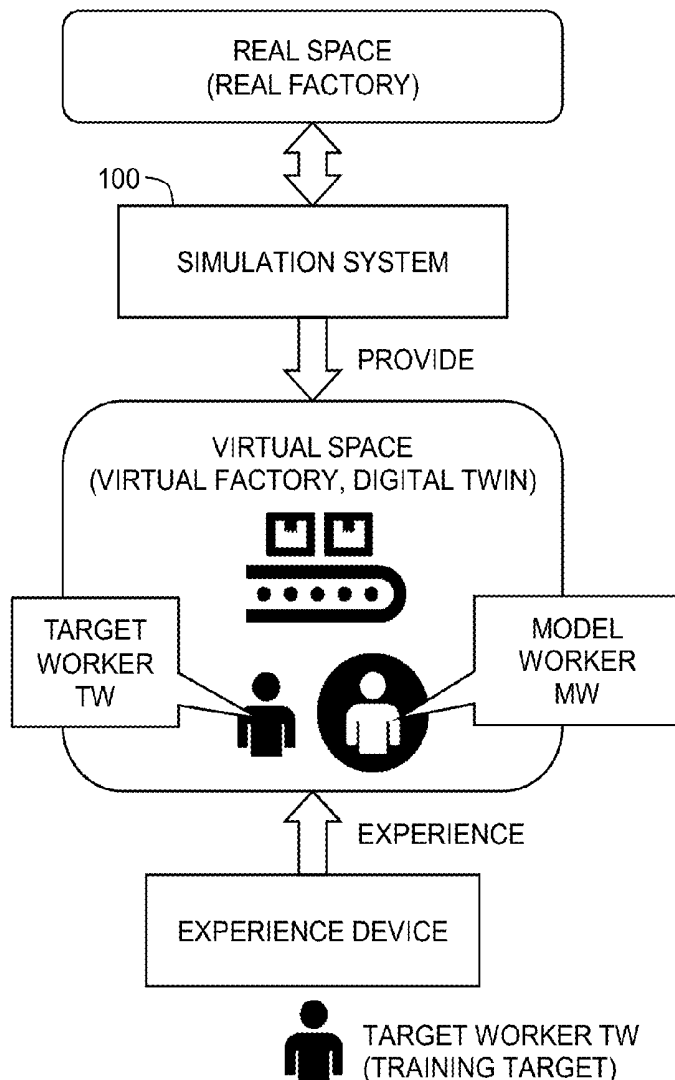

A work line includes: a first work carried out by a first target worker; and a second work carried out by a second target worker on a resultant product of the first work. A first model motion is a model motion when the first target worker passes the resultant product of the first work to the second target worker. A second model motion is a model motion when the second target worker receives the resultant product of the first work from the first target worker. When the first target worker carries out the first work in a virtual space, a simulation system draws a first model worker performing the first model motion in the virtual space. When the second target worker carries out the second work in the virtual space, the simulation system draws a second model worker performing the second model motion in the virtual space.

Proposed is a hydrogen management system in which location information, pressure information, temperature information, collision information, hydrogen concentration information, and flow rate information are transmitted from sensors mounted in a manifold of each of a plurality of tube trailers (T1, T2, . . . ), and the hydrogen consumption amount, the remaining hydrogen amount, the number of users, etc. are transmitted from the plurality of hydrogen charging stations (S1, S2, . . . ) so that current hydrogen storage and demand amounts are predicted, thereby managing an entire hydrogen cycle, including hydrogen production, in an integrated manner.

Systems and methods are provided for wireless cascading water heater systems. The wireless cascading water heater system may include several water heaters that may include one or more of a tankless water heater, a boiler, or a combination boiler, for example. One or more of the water heaters may communicate with a remote controller and/or a user device. The water heaters may further be in wireless communication with one another. One water heater may be designated the lead water heater and a second water heater may be designated the backup water heater. The lead water heater may oversee operation of the follower water heaters in response to a hot water demand. A hierarchical order may be determined for selecting which water heaters will respond to hot water demand and in what order. The hierarchical order may be based on the age of the water heater, burn time for the water heater for optimization and efficiency purposes.

(57) **ABSTRACT**

Aspects of the disclosure are directed towards artificial intelligence-based modeling of target objects, such as aircraft parts. In an example, a system initially trains a machine learning (ML) model based on synthetic images generated based on multi-dimensional representation of target objects. The same system or a different system subsequently further trains the ML model based on actual images generated by cameras positioned by robots relative to target objects. The ML model can be used to process an image generated by a camera positioned by a robot relative to a target object based on a multi-dimensional representation of the target object. The output of the ML model can indicate, for a detected target, position data, a target type, and/or a visual inspection property. This output can then be used to update the multi-dimensional representation, which is then used to perform robotics operations on the target object.

Robot controller cabinet and robot including such a cabinet. The disclosure relates to a robot controller cabinet including a chamber. First and second electronic units include an electronic component with a high heat flux and with a moderate heat flux, respectively. A cooling channel includes a fan and an inlet provided on a front side of the cabinet. An air-to-component heat exchanger supporting a cooling element. The disclosure also relates to an air-air cross-flow exchanger arranged in the channel and includes a first cooling circuit with an inlet and an outlet passing through a bottom panel of the chamber and second cooling circuit with a parallel inlet and outlet. The inlet is opposite the inlet of the channel. A fan, generating in the first cooling circuit an airflow perpendicular to an airflow generated in the second cooling circuit by the fan of the channel.

54 Méthode, outil et système de prévision de disponibilité de la ressource en eau.

57 Méthode de prévision de disponibilité de la ressource  
en eau à un instant de calcul, à partir de données d'entrée  
de précipitations sur un intervalle de temps prédéterminé et  
de données historiques enregistrées sur une période histo-  
rique antérieure audit instant donné, lesdites données histo-  
riques étant constituées de données d'entrée de  
précipitations et éventuellement d'évapotranspiration et de  
données de sortie de débit d'eau. La méthode combine :

- un modèle conceptuel à réservoirs pluie-débit, modèle  
dont les paramètres sont calibrés pour coïncider avec les  
données historiques,  
- un modèle à apprentissage automatique, dont l'ap-  
prentissage a été effectué sur la base des données histo-  
riques d'entrée de précipitations et de données de sortie  
constituées d'un écart constaté entre :

a) une prévision rétrospective de débit fournie par le mo-  
dèle conceptuel à réservoir calibré sur les données histo-  
riques, à chaque instant de la période historique,  
b) le débit d'eau enregistré au même instant de la pé-  
riode historique,

La prévision consiste à  
- obtenir, du modèle conceptuel à réservoir calibré sur  
les données historiques, une prévision provisoire de débit à  
l'instant de calcul, à partir des données d'entrée de précipi-

tations sur l'intervalle de temps prédéterminé,  
- obtenir, du modèle à apprentissage automatique, une  
prévision de correction au même instant de calcul et à partir  
des mêmes données d'entrée sur l'intervalle de temps pré-  
déterminé,

- combiner la prévision provisoire et la prévision de cor-  
rection pour obtenir une prévision de débit.

L'invention concerne également un outil et un système  
de prévision.

(57) **ABSTRACT**  
A method for selecting forecasting models for generating timeseries workload forecasts for a contact center covering varying timeseries granularities and operating horizons. The method includes selecting, via a first selection process, a first select forecasting model from first candidate forecasting models for forecasting a workload level in accordance with a lower-granularity timeseries. The first selection process may include the steps of: receiving a first timeseries dataset; defining different timeseries datasets within the first timeseries dataset, including a first shorterterm dataset and first longerterm dataset; testing, using the first longerterm dataset, each first candidate forecasting model in accordance with a first longerterm cross-validation process; testing, using the first shorterterm dataset, each first candidate forecasting model in accordance with a first shorterterm cross-validation process; and calculating, for each of the first candidate forecasting models, an combined accuracy score based on the testing.

(57) **ABSTRACT**

A method for determining a select forecasting model from among candidate forecasting models for improving workload forecasts generated by a single forecasting model that cover both longterm and shorterm operating horizons. The method may include: receiving a timeseries dataset having values associated with operational metrics of a contact center; receiving the candidate forecasting models, each of the candidate forecasting models configured to receive values of the input operational metrics and calculate therefrom a forecasted value for a value of a target operational metric; using the timeseries dataset to test each of the candidate forecasting models in accordance with a cross-validation process; and selecting the select forecasting model from among the candidate forecasting models based on comparing accuracy scores calculated for the candidate forecasting models as part of the cross-validation process.

(57) **ABSTRACT**

Apparatuses, systems, and methods are provided for career development are provided. The method comprises: (1) receiving, by one or more processors from a user device, an information element associated with a user; (2) generating, by the one or more processors via a chatbot, career development suggestions based upon the information element associated with the user; and/or (3) presenting, by the one or more processors to the user via the user device, the career development suggestions. The chatbot may implement a trained model.

(54) Bezeichnung: **System zur Vereinzelung von Stofflagen**

(57) Zusammenfassung: Die vorliegende Erfindung betrifft ein System zum Handhaben und Verarbeiten von Stofflagen (111). Das System weist einen Handhabungsroboter (100) mit einem Effektor (101) zum Handhaben von Stofflagen (111) auf, wobei der Effektor (101) eine Handhabungsmechanik (120) aufweist, die ausgebildet ist, zumindest eine Stofflage (111) aufzunehmen und abzulegen. Die Handhabungsmechanik (120) weist eine Effektorkontur (106) auf, wobei innerhalb der Effektorkontur (106) die Stofflage (111) befestigbar ist, wobei die Effektorkontur (106) kleiner als eine Außenkontur der Stofflage (111) ist. Die Handhabungsmechanik (120) ist derart konfiguriert, zumindest eine Stofflage (111) einzeln aus einem Stofflagenstapel (112) zu vereinzelern und aufzunehmen, zumindest eine vereinzelte Stofflage (111) auf einer Arbeitsfläche (102) eines Arbeitstisches (103) flach abzulegen, und die Stofflage (111) innerhalb der Effektorkontur (106) faltenfrei aufzuspannen. Ferner weist das System eine Überwachungsrichtung (130) auf, welche konfiguriert ist zur Überwachung der Vereinzelung der zumindest einen Stofflage (111) von dem Stofflagenstapel (112).

A learning system for a navigating robot includes: a navigation module including: a first policy configured to determine actions for moving the navigating robot and navigating from a starting location to an ending location based on images from a camera of the navigating robot; and a second policy configured to, based on a representation of an environment generated by the navigating robot, determine actions for moving the navigating robot from waypoint locations between the starting location and the ending location to a plurality of subgoal locations without any images from the camera; and a representation module configured to: selectively learn the representation during movement via the first policy based on the representation at previous times, images from the camera, and actions determined by the first policy at previous times; and provide the representation to the second policy.

A process for artificial intelligence (AI)-based intelligent workflow improvement monitors and records progressions of users through an intelligent workflow (IW). The IW includes computerized activities through which the users progress through interactions with the IW via graphical user interfaces. The process extracts features of the monitored and recorded progressions as reflected by the stored data records. The process builds and trains at least one AI model using the extracted features. The process generates, using the at least one AI model, customized recommendations for improvement of the IW. The customized recommendations include a training action for presentation to a user progressing through the IW. The process also outputs the customized recommendations. The outputting includes dynamically presenting the training action to the user on a graphical user interface through which the user interacts with the IW as part of progressing through the IW.

(72) Inventor: **Michael Shrader**, Englewood, CO (US)

An apparatus and method for generating a skill profile, the apparatus including at least a processor and a memory communicatively connected to the processor, the memory containing instructions configuring the processor to receive user data including a plurality of skillsets, receive reception feedback, retrieve network data utilizing a web crawler, generate a plurality of skillset summaries as a function of the user data and reception feedback, generate a skill summary bank including the plurality of skillset summaries, generate a performance score for each skillset summary in the skill summary bank, rank the plurality of skillsets summaries based on the performance score and network data, and generate a skill profile based on the ranked plurality of skillset summaries.
